Integrate, Automate, and Unify Your Enterprise

A well-planned integration strategy delivers more value and flexibility than a tangled web of point-to-point integrations.

The Saltbox Platform from Vision33 is an enterprise-class, low-code integration platform as a service (iPaaS) solution that empowers small and mid-sized companies to integrate, unify, and streamline business operations, accelerate automation efforts, and increase the ROI of existing data and technology investments.

Saltbox Connectors Are the Building Blocks of Integration

The Saltbox Platform relies on a growing library of connectors that integrate with any application, data set, or business process, whether they're in the cloud or on-premises. Every connector is customizable to address unique integration scenarios.

Pre-built application connectors accelerate integrations between popular, mission-critical business systems like ERP, CRM, marketing automation, and POS. They update dynamically, saving IT time and preventing operational disruption. Standard workflows are pre-built and easily customized to support any automation scenario.

Utility connectors extend workflow functionality or connect to legacy applications that don't have modern APIs. Popular utility connectors include SQL, SFTP, SMTP/POP3, and file processing (e.g., JSON, CSV, and XML).

The universal API connector accelerates custom integration projects for applications with standards-compliant REST APIs.

The API gateway connector facilitates real-time integration between Vision33's The Saltbox Platform and any third-party application. It provides a secure, bi-directional pathway to trigger workflows and transmit mission-critical business data.

Custom integration solutions are available for legacy and proprietary applications.

Workflows Automate Any Business Scenario

Workflows define and automate the flow, treatment, and delivery of transactional data between systems. Pre-built connectors have standard workflows to quickly automate common business tasks and processes. Workflows can be used as-is, customized, or developed from scratch for more complex scenarios.
